The present sequence for Mycobacterium bovis rpoB gene fragment is 1 of 24 poB gene fragments (AAS05201-AAS05224) from various Mycobacterial species. These rpoB gene fragments can be used in the diagnosis and identification of Mycobacterium species using a novel PCR-restriction fragment length polymorphism analysis (PRA) a method. The method comprises obtaining a restriction fragment length polymorphism (RFLP) pattern of the 24 ppbB gene fragment; isolating, amplifying and digesting the DNA fragment from the microorganism to be identified and comparing the RFLP patterns from the known rpoB gene fragments.
                                                                                                                                                                                                                                                                      Claim 1; Page 45; 50pp; English.

Analysis of the rpoB gene required), and can differentiate between many species in a single experiment, including those difficult to distinguish by usual biochemical tests. Also described are oligonucleotide probes (AASO5227-AASO5242) for distortion of the properties of the probes (AASO5227-AASO5242) for distinguish by usual biochemical detecting specific Mycobacterial species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 208 BP; 46

This oligonucleotide DNA primer is specific for Mycobacterium tuberculosis, and may be used to amplify a sample DNA by targeting a portion of the gene encoding rpoB. The 1st several bases comprise nonhybridizing tail consisting of filler bases followed by a restriction site incorporated to facilitate cloning using the amplicon at a later date, if desired. The remaining bases hybridize to bacterial rpoB DNA. The method provides for the detection of M. susceptibility, particularly to rifamycin. The method can provide often greater than 95% sensitivity and 100% specificity. The biological sample is a fluid or tissue sample from a human.
                                                                                                                              Disclosure; Fig.3; 54pp; English.

This invention relates to a method for identifying a nucleotide or polypeptide sequence that may be a drug target, or essential for growth represent DNA encoding proteins. Polynucleotide sequences AAH51947 - AAH52092 tuberculosis proteins which are potential drug targets. The DNA and protein sequences are used to illustrate the method of the invention. The method involves providing an unknown nucleotide or polypeptide sequences, algorithm capable of analysing a functional relationship between characterising the function of nucleic acids and polypeptides sequences. The method is useful for useful as a target for a drug or essential for the growth or viability of an organism

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a method for generating a repertory of nucleic acids of tuf, fus, atpD and/or reca genes from which probes and/or primers are derived. The method comprises amplifying the nucleic acids of determined algal, archaeal, bacterial, fungal and parasitical species with a combination of defined primer pairs. The method can be used for producing probes and/or primers for detecting one or more related microorganisms e.g. algae, archaea, bacteria, fungi and parasites, for universal detection and for specific and ubiquitous detection and identification of an algal, archaeal, bacterial, fungal
                                                                                                                           Nucleic acid sequences are used to generate universal probes and primers which can be used to identify and detect the presence of algal, archaeal, bacterial, fungal and parasitical species in a test sample -

```
and parasitical species, genus, family and group. A nucleic acid (1)

cobtained using the method of the invention can be used for the universal
detection of any bacterium, fungus or parasite in a sample and for the
detection of at least one antimicrobial agent resistance gene or at
least one toxin gene. haxA nucleic acids are used for the specific and
tubiquitous detection and for identification of Streptococcus pneumoniae.

(1) can be used to design a therapeutic agent which is effective against
which can be detected include Abiotrophia adiacens, Bordetaila sp.,
which can be detected include Abiotrophia adiacens, Bordetaila sp.,
Mycobacteriaceae family, Pseudomonads group, Escherichia coli,
Nycobacteriaceae family, Pseudomonads group, Streptococcus as p.,
Nycobacteriaceae family, Pseudomonads group, Streptococcus as p.,
Drovides faster results than substrate specificity tests as results can
be determined in an hour and improved accuracy is also acideved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    AAH00010 to AAH002304 represent nucleotide sequences and primers/probes which are given in the exemplification of the present invention.

The present sequence is the rpoB gene from Mycobacterium tuberculosis. Rifamphin resistance is largely associated with point mutations localised in a small core region of 81 base pairs in the rpoB gene, which encodes the RNA polymerase beta subunit. To detect a mutation, a complex is formed comprising a first sequence representing the predetermined region of the gene of the organism and a second sequence representing the corresponding region of the gene of the wild type organism in double stranded form. Each member of at least one pair of non-complementary strands within the complex has a label. The association of the labels in the complex is related to the presence of the mutation. The presence of the mutation is related to the drug resistance of the strain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 GCCTGAACGCCGGCCAGCCGATCACGTCGTCGACTCTGACCGAGGAAGACGTCGTCGCCA 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (URL, http://www.sanger.ac.uk/Projects/M_tuberculosis/) CDS have been renumbered from the original cosmid submissions but the old gene designations are in brackets after the new gene numbers. Gene prediction was based on a Hidden Markow Model of TB genes implemented in TBparse (Krogh) supplemented with visual inspection of positional base preference in codons, especially where there is an increase in the observed/expected third position G + C. CAUTION: In some cases we may not have predicted the correct initiation codon. Where possible we choose an initiation codon (atg, or ttg) which is preceded by an upstream ribosome binding site sequence (optimally 5-13bp before the initiation codon). If this cannot be identified we choose the most upstream
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Details of M. tuberculosis sequencing at the Sanger Centre are available on the World Wide Web.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /note="agga, possible rbs upstream of Rv0654"

                                                                                                                               Anotes Vector: Landar All Bardelli were disrupted using a Mini bead beater (Blospec). RNA was isolated using the RNeasy protocol (Olagen). Purified RNA was subjected to 2 rounds of digestion with RNase free DNase I (Promega). DNase I was heat-inactivated at 750c for 5 min. and removed by using RNeasy columns followed by phenol removed by using RNeasy columns followed by phenol preparations were confirmed to be free of genomic DNA contamination by carrying out PCR and RT-PCR using the Access kit (Promega) and primers specific for the histone-like protein gene hip (Lee et al., 1998). CDNA was synchesized using random hexamer primers (Promega) and Stratagene's cDNA synthesis kit. CDNA fragments were ligated into lambda App II vector and packaged in vitro using Stratagene reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Eukaryota: Viridiplantae, Streptophyta; Embryophyta: Tracheophyta; Spermatophyta: Magnoliophyta; Liliopsida; Poales; Poaceae; Pooldeae; Triticeae; Triticeae; Pooldeae; Triticeae; Triticeae; Pooldeae; To 649)

/dote="Vector: Lambda Uni-ZAP XR, excised phagemid;
Site_1: EcoRi; Site_2: XhOi; Plants were grown under
hydroponic conditions at UC Davis, salt stressed for 12
hours, and for 7 days, then dissected and frozen (Akhunov
in J Dvorak Lab). Total RNA was prepared from the two
samples, polyA was purified from the pooled RNA, a cDNA
library was made, and the CDNA clones were in vivo
excised to give pBluescript phagemids in the TJ Close lab
at the University of California, Riverside (Akhunov, Chin
/ Close, Fenton, Kianian, Otto, Simons, Zhang).
Plasmid DNA preparations and DNA sequenching were
performed in the Ob Anderson lab (all other authors)."

Site_1: Econi; Site_2: XhOi; Plants were grown to seed maturity under conditions favoring seed dormancy (L.
Dohery at K. Walker_Simmons lab, Washington State University, Pullman, WA). Embryos were cut from mature dormant seed (Doherty). Total RNA was prepared from these embryos, polyA was purified, a cDNA library was made, and the CDNA clones were in vivo excised to give pBluescript phagemids in the TJ Close lab at the University of California, Riverside (Chin, Penton). Plasmid DNA Preparations and DNA sequencing were performed in the OD Anderson lab (all other authors)."
